Prefrontal

The executive-function assistant that learns how *you* actually work.

Self-hosted · local-first
Runs on your network, always on
Open source (MIT) · live & in daily use

Most productivity tools assume you'll remember to use them.

Prefrontal doesn't. It watches your context — location, calendar, time of day, recent activity — decides on its own when to speak up, and nudges through the channel you'll actually notice. Then it learns from whether the nudge *worked*. **It gets better the longer you use it.**

🧠 **Learns from what worked**
Not another to-do list — a model of you.

👆 **One tap, or it fails**
If logging is harder than ignoring, it's useless.

🔒 **Your data stays home**
Nothing leaves your network unless you say so.

✓ WHAT IT DOES TODAY — LIVE, WITH A CONCRETE EXAMPLE

⏰ Departure reminders

> *"2:14 — leave in 6 min for the 2:45 dentist. Traffic's heavy."*

Factors in real traffic, then escalates **push → sound → phone call** until you answer. **On time, no nagging.**

🔔 Nudges that decide themselves

> *It picks the moment, the words, and the channel — and you tap "Wrap up" or "I'm back" right from the lock screen.*

A coaching engine, quiet hours and all. **A coach, not an alarm clock.**

🧯 Panic mode

> *Frozen? One tap → what's actually on fire, what to ignore, and one 5-minute first step.*

Just where to put your hands next — not the whole plan. **Breaks the freeze.**

🎯 Hyperfocus guard

> *Three hours down a rabbit hole? A gentle check. Deep in the right thing? It shields you from every other ping.*

Protects good focus, interrupts the costly kind.

✅ The right task, right now

> *"20 min free at 4pm — knock out 'call the pharmacy.'" Short, low-energy, and the thing you keep dodging.*

Matches effort to your energy and the clock. **Not a guilt-list.**

💬 Edit your day in plain English

> *"Bump the dentist call to urgent and drop the dry cleaning." — Done.*

Type it how you'd say it; it previews, you confirm. **No forms.**

ALSO LIVE → Mail triaged to a short action list · Morning briefing · Bad-day recovery mode · One-tap lock-screen replies (ntfy) · Multiple users, each learns on their own

It quietly learns → your **real** departure lag, **which reminders you ignore after 3pm**, when you tend to go quiet, how much you underestimate time — and tunes its timing, wording, and channel to **you**. Miss a reminder? That's data too.

→ WHERE IT'S GOING NEXT

- → **Context Packs.** Role-based bundles — *Parent*, *Caregiver*, *New job* — that pre-wire the primitives for a whole life situation.
- → **One intake for everything.** Mail, a calendar change, a quick thought — captured, sorted, and routed the same way.
- → **First-class delivery.** Native Pushover / ntfy / TTS publishing (today it routes through n8n).
- → **Shared co-parent sheet.** One household sheet both parents edit in plain English — sizes, appts, behavior plans — to balance the invisible load.
- → **Sharper learning.** Per-situation time drift, learned channel response, tuned quiet hours.
- → **Live lock-screen timer.** A real countdown for an active outing, in the Dynamic Island.

⚙ UNDER THE HOOD — FOR THE CURIOUS

A system of small, single-purpose agents over a **local SQLite behavioral memory** — the core everything learns into. **Capture → triage → memory → coaching → delivery.** A **coaching tick engine** asks each module "anything due?" and picks the channel; a **FastAPI** surface takes one-tap input from **iOS Shortcuts**; **n8n** orchestrates; **Ollama** runs inference on-device (optional **Claude** per task); reminders escalate over **Pushover / ntfy / TTS** with one-tap action buttons; everything's reachable over **Tailscale**, multi-user. Switch on only the ADHD modules that fit your profile.

`Python 3.10+` `FastAPI` `SQLite` `Ollama` `Anthropic (optional)` `n8n` `iOS Shortcuts` `Tailscale` `ntfy / Pushover` `MIT license`

Prefrontal — built with lived executive-function experience, not against it.

Local-first • escalation is not optional • learn from failure, not just success
