

Parent Pack · Prefrontal

A Context Pack: the primitives you already have, wired for the shape of parenting.

Composition, not a new app
Opt-in · shareable · self-hosted
Backbone shipping · Pack on the roadmap

Modules answer *how your ADHD shows up*. A Pack answers *what life you're managing*.

Parenting with ADHD is an executive-function stress test — departures, hand-offs, the invisible inventory of sizes, appointments and who's on pickup. The Parent Pack doesn't add another app; it **composes the primitives Prefrontal already runs** — departure, panic, task-breakdown, coaching — into the shape of a parent's day, and adds one shared sheet both co-parents keep current. **Turn it on; it wires the rest.**

✚ Composition over primitives

Not a new module — a bundle that wires the ones you have.

⚖ Balances the invisible load

Every fact stamped who-set-it, pushed to the other parent.

📦 One tap to install

Seeds the vocabulary, windows, and tools for "parent."

✓ WHAT WORKS TODAY — THE SHIPPED PRIMITIVES, IN A PARENT'S DAY

🚶 School-run departure

"8:02 — leave in 6 min for drop-off.
Roadwork on Elm adds 4."

Real traffic, then escalates **push → sound → call** until you move. **Out the door on time.**

🎒 Pack the bag, one step at a time

"Library books → gym kit → the permission slip." One move at a time, not the whole scramble.

Task-breakdown turns "get them ready" into the next single action. **Beats the freeze.**

🤔 Kid's home sick → replan

One tap: *what actually has to move today, what to drop, and your one next step.*

Panic mode re-fits the day into the hours you suddenly have. **No spiral.**

✅ The right task in a 20-min gap

"20 min before pickup — call the pediatrician." Short, low-energy, the thing you keep dodging.

Matches effort to the clock you actually have. **Not a guilt-list.**

✉ School mail, triaged

Permission slip, picture day, dues due Friday → a short action list, not a 40-email inbox.

The three things that need *you*, surfaced. **Nothing slips.**

💬 Edit the day in plain English

"Move Sam's dentist to Thursday and add cleats to the shopping list." — previews, you confirm.

Say it how you'd text it; it validates and shows you first. **No forms.**

ALSO TODAY → Two parents, each learns on their own Quiet hours & bad-day mode One-tap lock-screen replies Runs on your own network

→ WHAT THE PACK PRE-WIRES (ROADMAP)

- **One-tap setup.** Switches on the challenge modules a parent needs and seeds the vocabulary — a *child* appointment kind, kid-tagged todos, school-run windows.
- **Shared co-parent sheet.** Both parents read *and write* one household sheet in plain English — sizes, routines, allergies, providers, behavior plans, appointments.
- **Tailored family view.** One glanceable sheet — kids' facts · agreements · upcoming appts · recently changed — reusing the profile render, not a new UI.
- **Situation tools.** Thin compositions of the primitives — school-run departure, pack-the-bag checklist, "who's covering pickup?", sick-day replan — no new app, just wiring.
- **Delta digest.** Every entry stamped who-set-it-when; the coaching layer pushes the changes that matter to the parent who *didn't* make them.
- **Shareable.** "Install the Parent pack" — the same opt-in, modular ethos as challenge modules, on the orthogonal life-context axis.

The shared sheet →

Everything you need to step in and help — any time, no asking required. Shoe size, the EpiPen, the sticker plan, who's the dentist — each **stamped with who updated it and when**, so "who's carrying the mental load" is finally legible, and the deltas get pushed to the other parent instead of living in one head.

⚙ HOW A PACK WORKS — FOR THE CURIOUS

A Pack is a **composition layer**, not a **Module** subclass — modules sit on the executive-function axis, "parent" on the orthogonal **life-context** axis. It's mostly **declarative** plus a small tool registry: it (1) enables a subset of challenge modules, (2) seeds domain vocabulary — commitment **kinds**, todo categories, default windows, (3) registers **situation tools** that compose shipped primitives — **todos, commitments, departure, panic, decompose_task, the NL-assistant whitelist** — and (4) tailors the family view. Nudges route through the same **coaching tick engine**; the co-parent sheet adds a **household scope** alongside per-user multi-tenancy — two users, one set of rows, every write attributed.

Context Pack composition layer household scope facts + agreements provenance (updated_by) NL-assistant ops
reuses departure / panic / decompose coaching tick engine family view
